W1 · Home

Today's booking first; points with a purpose; tabs instead of a hidden menu

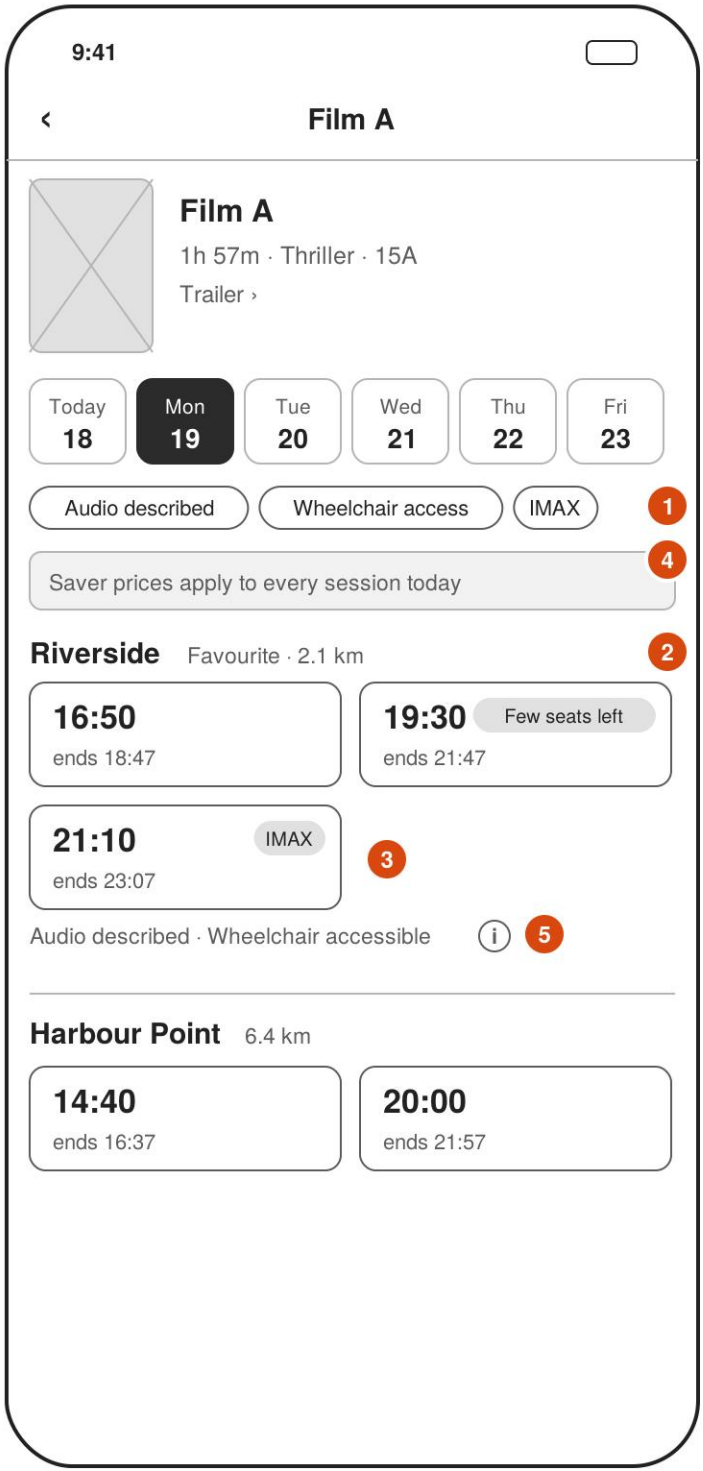

WHAT CHANGES AND WHY

1. On the day of a booking, the ticket is the first thing on Home: time, screen, seats and one tap to the QR code. Today it sits under Profile → Purchases or in a separate email.
2. Points get a meaning: progress to the next reward and a route to spend them. Today '500 points' appears with no value or use.
3. The current chips read '39m', which can be mistaken for runtime. 'Starts in 39 min' says what it means.
4. The subscription promotion stays, but as one card rather than roughly half of the first screen.
5. A bottom tab bar replaces the hamburger menu, so Tickets and Rewards are always one tap away.
6. Help is a permanent icon, not a link at the bottom of a hidden menu. It opens the assistant (W8).

W2 · Choose a session

Words instead of codes; end time and format up front; favourite cinema first

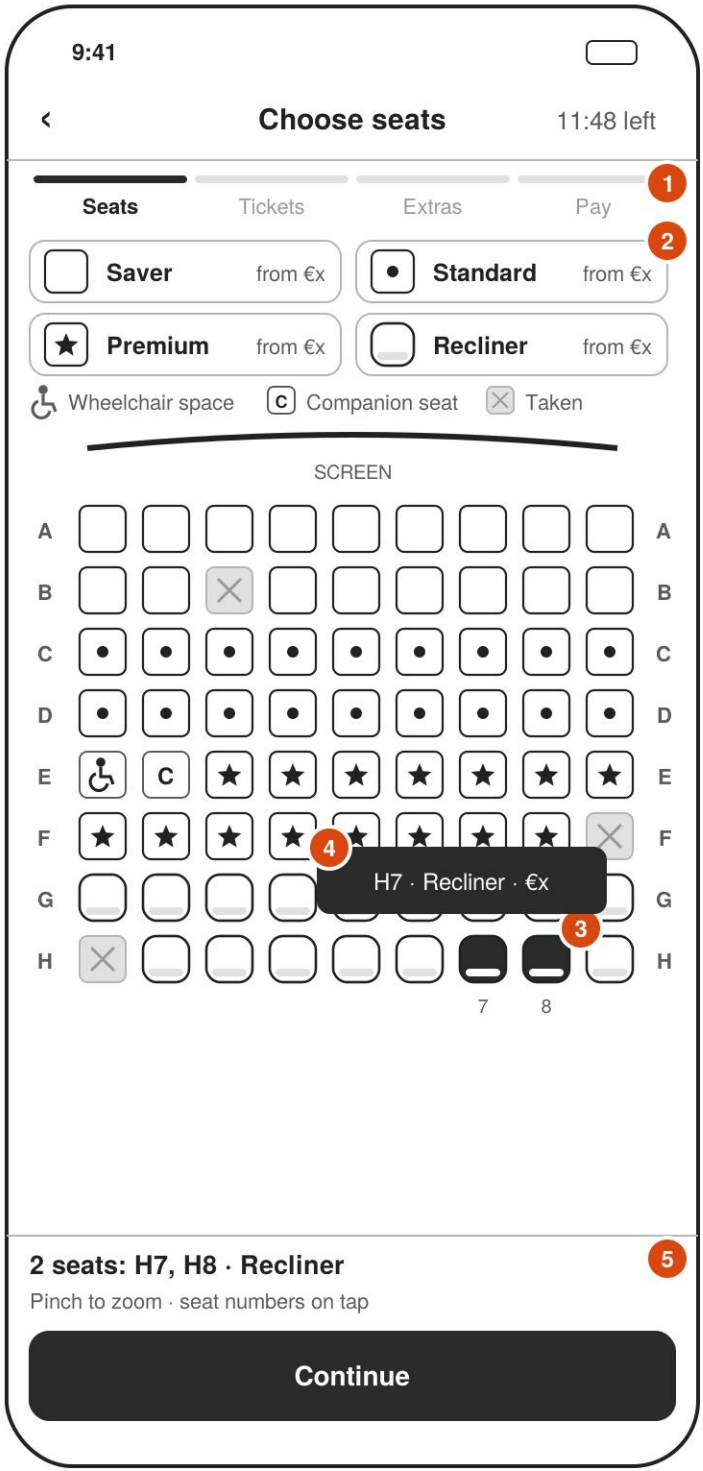

WHAT CHANGES AND WHY

1. Filter chips for accessibility and format. Guests who need audio description or step-free access see only sessions that work for them, and can save it as a preference.
2. The favourite cinema comes first, then the rest by distance. Today the list is alphabetical, so a favourite can sit at the bottom.
3. Each time shows when it ends; format and 'Few seats left' appear only when true. Guests regularly ask about end times and screen type at the counter.
4. A deal that applies to every session is said once, not tagged on every button.
5. Accessibility attributes are written out, with an (i) explaining each. Today they are codes (AD, WA and an unlabelled icon) that even staff struggle to read.

W3 · Choose seats

Seat type shown by shape as well as colour; full legend; live selection summary

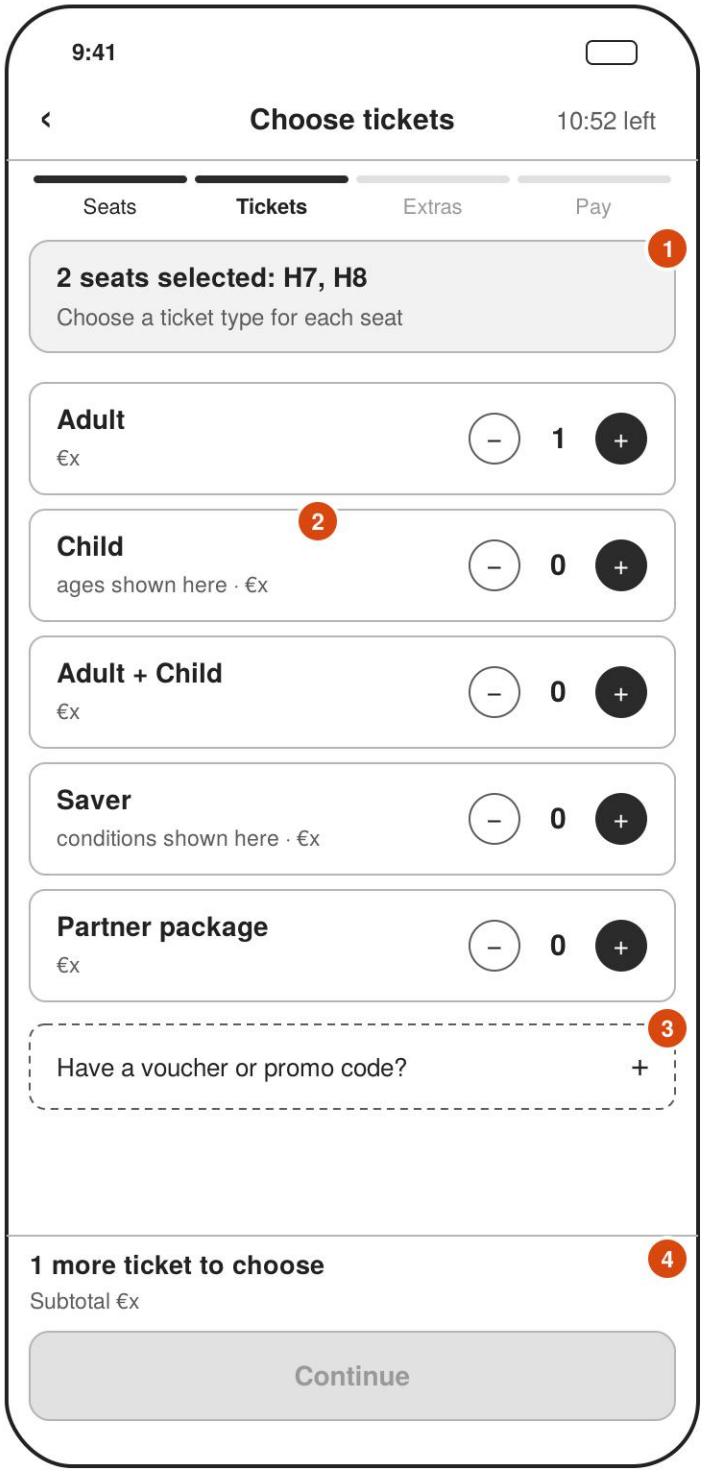

WHAT CHANGES AND WHY

1. A four-step indicator and the hold timer sit in the same place on every checkout screen, so the flow feels like one product.
2. Every seat type is visible at once with its starting price. Today the legend is a sideways carousel cut off at 'Classic…'.
3. Each type has a shape (plain, dot, star, recliner) as well as a colour, so it works for colour-blind guests (WCAG 1.4.1). Rows and seat numbers are labelled.
4. Tapping a seat names it: row, number, type and price.
5. The empty space above today's small map goes to a bigger map and a running summary of what is selected.

W4 · Choose tickets

Plain-language progress; one place for discounts; Continue explains itself

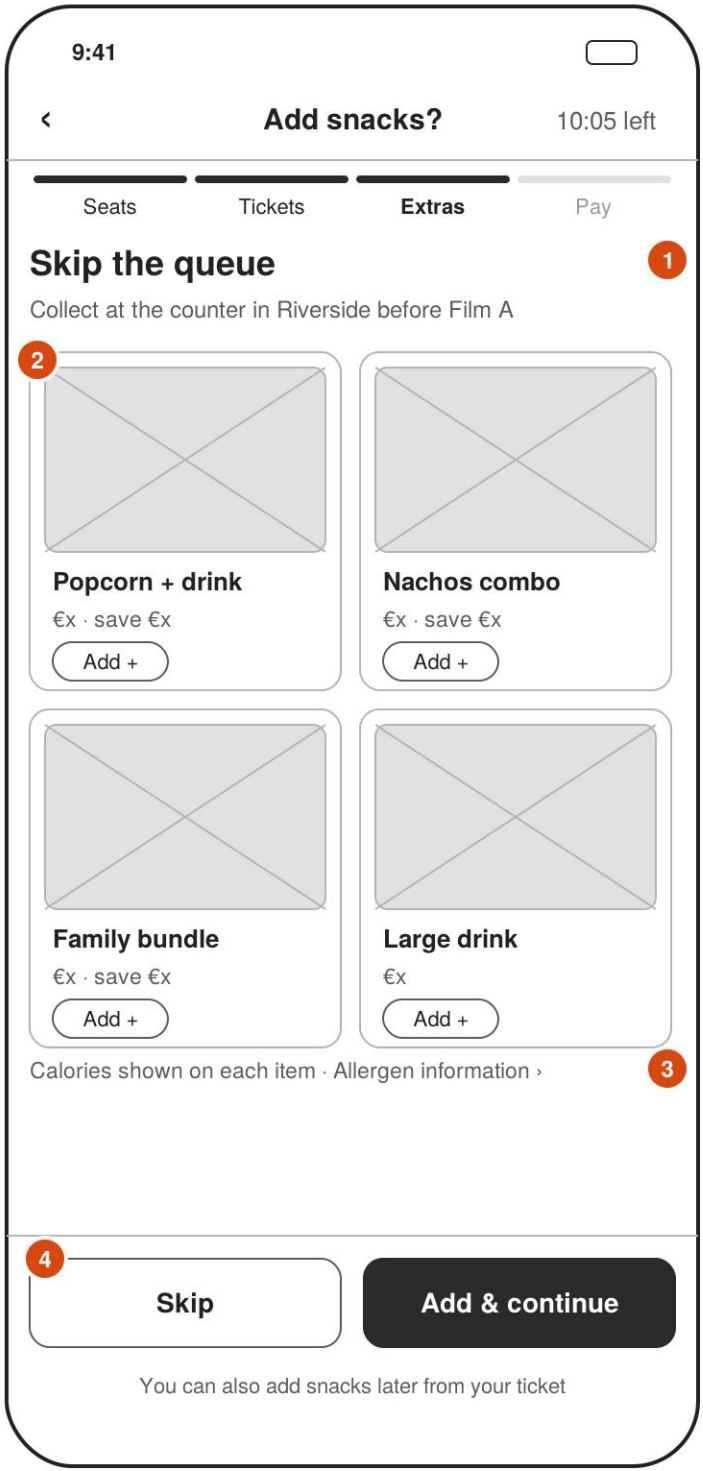

WHAT CHANGES AND WHY

1. Today the counter reads '0/1 Ticket(s) added', which looks like 'you are buying one ticket'. This says what has happened and what is needed.
2. Each ticket type carries its conditions (for example the age range for Child) so guests don't have to guess.
3. One entry point for discounts. Today there is a 'Redeem Vouchers' link and a separate promo-code field in the order sheet.
4. The disabled Continue button looks disabled and the line above it says why. Today the enabled and disabled states look almost the same.

W5 · Extras (optional)

Pre-order snacks inside the booking, for the same cinema, with an equal 'Skip'

WHAT CHANGES AND WHY

1. Snack ordering exists today, but only as a separate journey from the menu that starts by asking for the cinema again. Here it is one optional step in the booking.

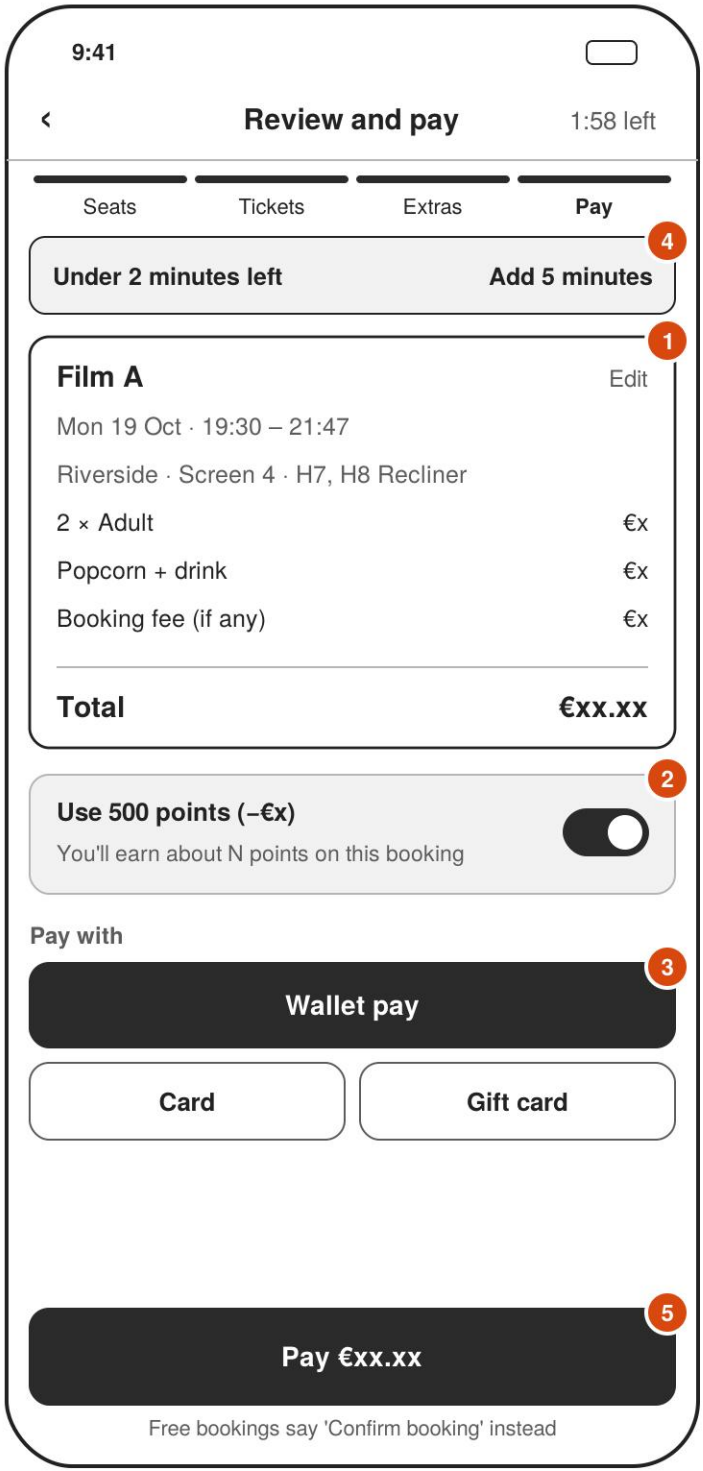

2. Only combos on sale at the booked cinema, with the saving shown. Depends on counters being able to fulfil pre-orders; to confirm with Operations before testing.

3. Allergen information becomes a tappable link. Today it is plain text pointing to a web address.

4. 'Skip' is as easy to tap as 'Add', so the step helps rather than pressures. Success is attach rate without a drop in booking completion.

W6 · Review and pay

The full order stays on screen at the moment money moves

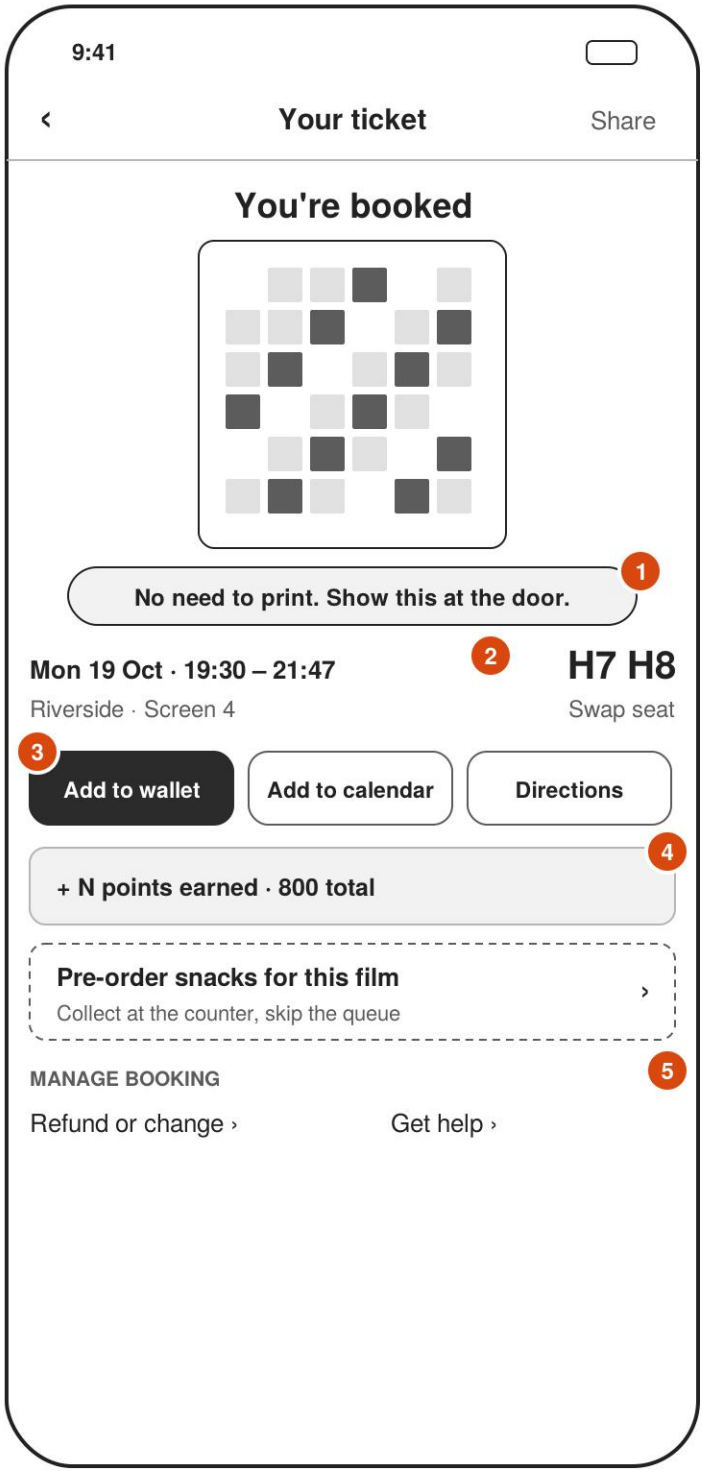

WHAT CHANGES AND WHY

1. A summary already appears as a collapsible sheet on the ticket screen, but disappears on the payment screen. Here it stays where the money is committed, with an Edit route.
2. Points finally show up in the flow: spend them here and see what this booking earns.
3. Wallet pay is one tap. Today it is under a row labelled 'Payment Options' on a screen also called 'Payment Options', then a second sheet.
4. A warning before the hold expires, with a way to extend it (WCAG 2.2.1 Timing Adjustable). Today the timer runs silently from ticket choice to payment.
5. The button names the action. A €0.00 booking currently still says 'Pay Now'.

Low-fidelity proposal · placeholder names and prices · not shipped

W7 · You're booked

One ticket, one email, and a clear 'no printout needed'

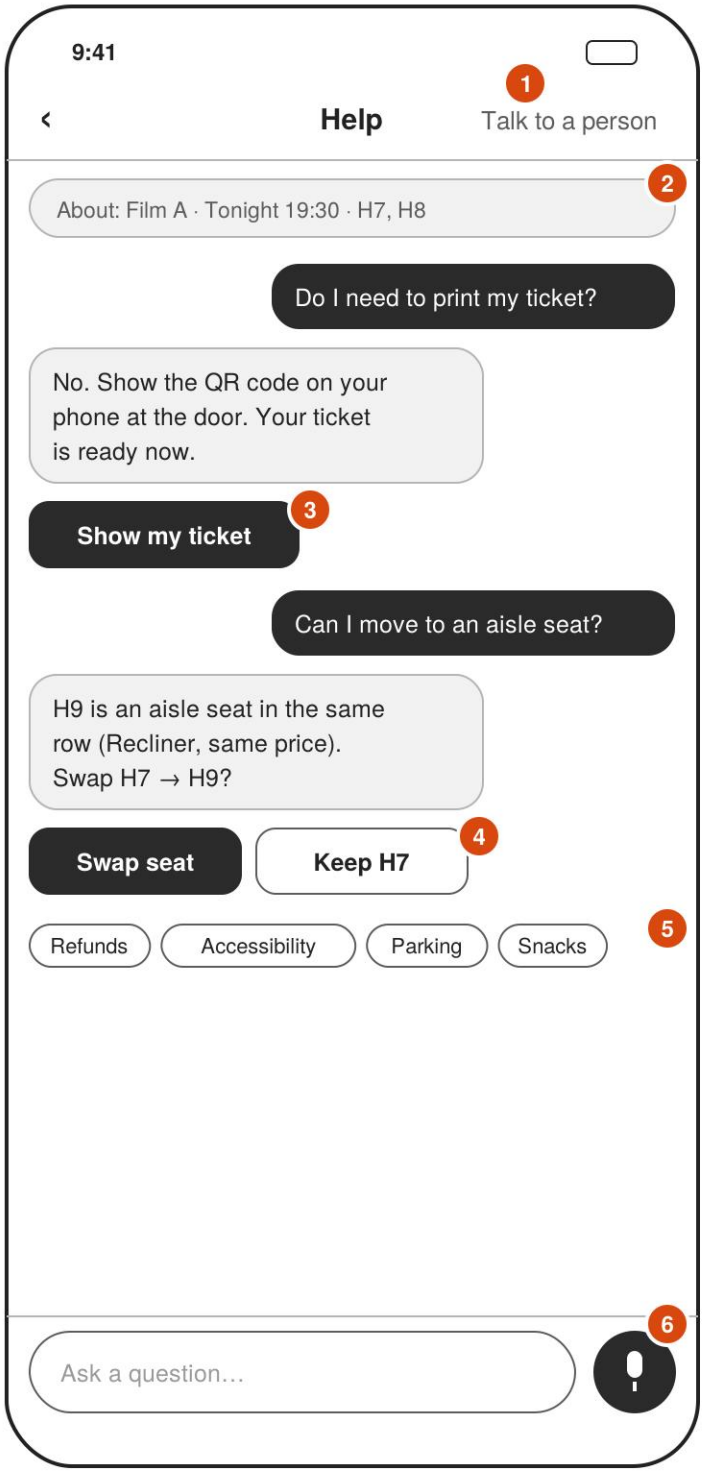

WHAT CHANGES AND WHY

1. Many guests think they need a printout or another step at the door. The answer is on the ticket, in the email and on the wallet pass.
2. Keeps what already works: big row and seat numbers, end time and Swap Seat. These are strengths of the current ticket screen.
3. Wallet already exists; calendar and directions are added. One confirmation email puts the QR code first with the receipt beneath it, instead of two separate emails.
4. Points earned are shown at the moment of reward.
5. Refund moves into a labelled 'Manage booking' area. Today it is a floating button that overlaps 'Add to Apple Wallet'.

W8 · Help assistant (chat)

Knows the booking, acts only with confirmation, and a person is always one tap away

WHAT CHANGES AND WHY

1. 'Talk to a person' is visible on every screen of the assistant. Guests should never have to trick a bot into escalating.
2. When opened from a ticket, the assistant already knows which booking the guest means, so the conversation starts from context.
3. Answers come from approved content (here, the entry policy) and end in an action, not just text.
4. Actions reuse what the app can already do (Swap Seat) and always ask before changing anything. Seat, type and price are read back first.
5. Suggested topics come from the most common guest questions. Refunds route to a person, not the bot.
6. Voice input in the app, sharing the same dialogue design as the phone line (see README).
